SKYROUTE TRAVEL WEBSITE

Unit 3 Project Documentation

Student Name: Ghadah Ammar Alabbadi
Technologies: HTML5 & CSS3
Project Type: Responsive Travel Website

1. Project Abstract

SkyRoute Travel is a responsive multi-section travel website developed using HTML5 and CSS3. The website presents travel services, popular destinations, company information, and contact options through a clean visual interface. It also includes a dedicated booking page where users can enter trip details such as departure and destination cities, travel dates, number of travelers, class, and additional requests.

The project demonstrates semantic HTML structure, external CSS styling, Flexbox, CSS Grid, responsive layouts, forms, hover interactions, transitions, pseudo-elements, CSS variables, and keyframe animations. The design uses a consistent blue and purple travel theme based on the SkyRoute Travel identity and adapts to desktop, tablet, and mobile screen sizes.

2. Website Design Documentation

The website was designed as a simple travel experience with clear navigation, large visual sections, reusable card layouts, and consistent spacing. Each section has a specific role while following the same visual theme.

2.1 Home Page Design

The home page begins with a responsive header and navigation bar, followed by a hero section containing the main travel message, call-to-action buttons, and travel illustrations. The services area directly below the hero introduces the main offerings through three responsive cards.

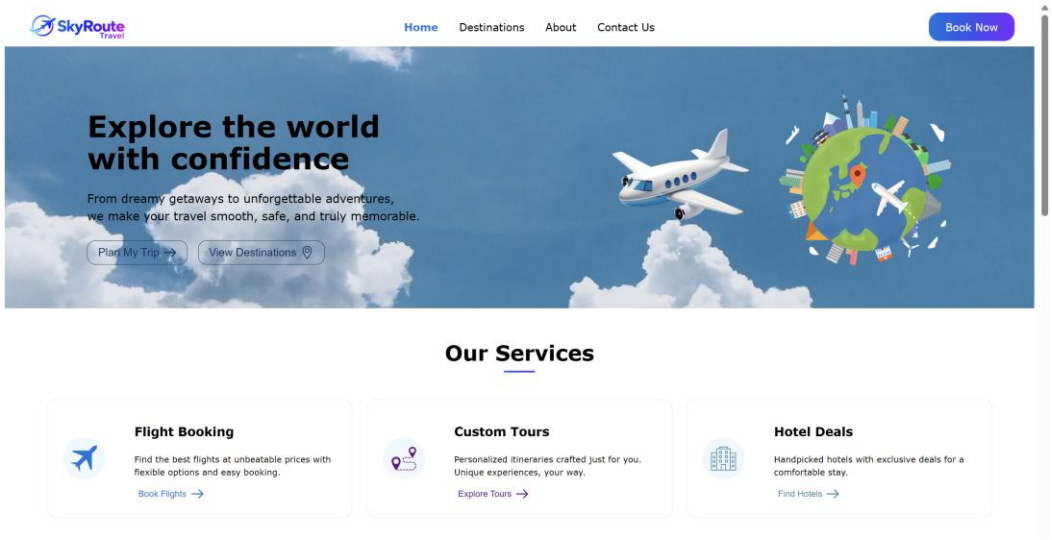

Figure 1. Home page hero and services design.

2.2 Services and Destinations

The services section contains three independent article cards: Flight Booking, Custom Tours, and Hotel Deals. CSS Grid is used to organize the cards, while hover transitions provide visual feedback. The Popular Destinations section presents Riyadh, Cappadocia, and the Maldives using image cards with short descriptions.

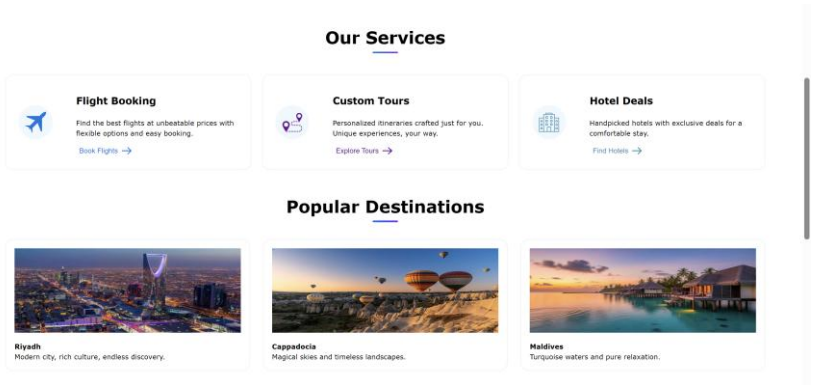

Figure 2. Services & Popular destinations sections.

2.3 About Section

The About section explains the purpose of SkyRoute Travel and highlights key service values. On larger screens, the image and content are arranged horizontally. On mobile screens, the layout changes to a vertical structure so the content remains readable and balanced.

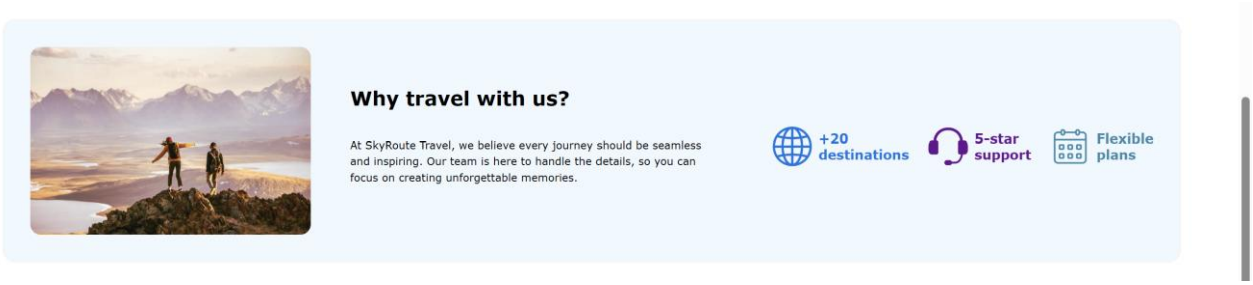

Figure 3. About section.

2.4 Contact Section

The Contact Us section is placed inside the footer area to satisfy the project requirements for contact information, social links, and a labeled form. It includes full name, email address, message, a required privacy-policy checkbox, and a Send Message button. Form fields use consistent rounded borders, icons, and the same blue-purple button theme used throughout the site.

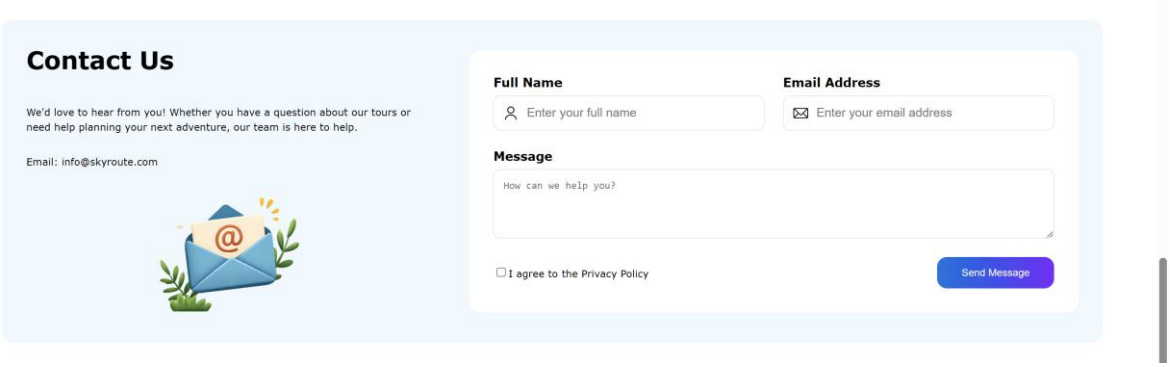

Figure 4. Contact section and contact form.

2.5 Booking Page

The Book Now page provides a dedicated trip-booking form. Users can enter personal information, departure and destination cities, travel dates, number of travelers, travel class, and optional requests. Grid and Flexbox layouts keep related fields aligned on desktop and stack them vertically on smaller screens.

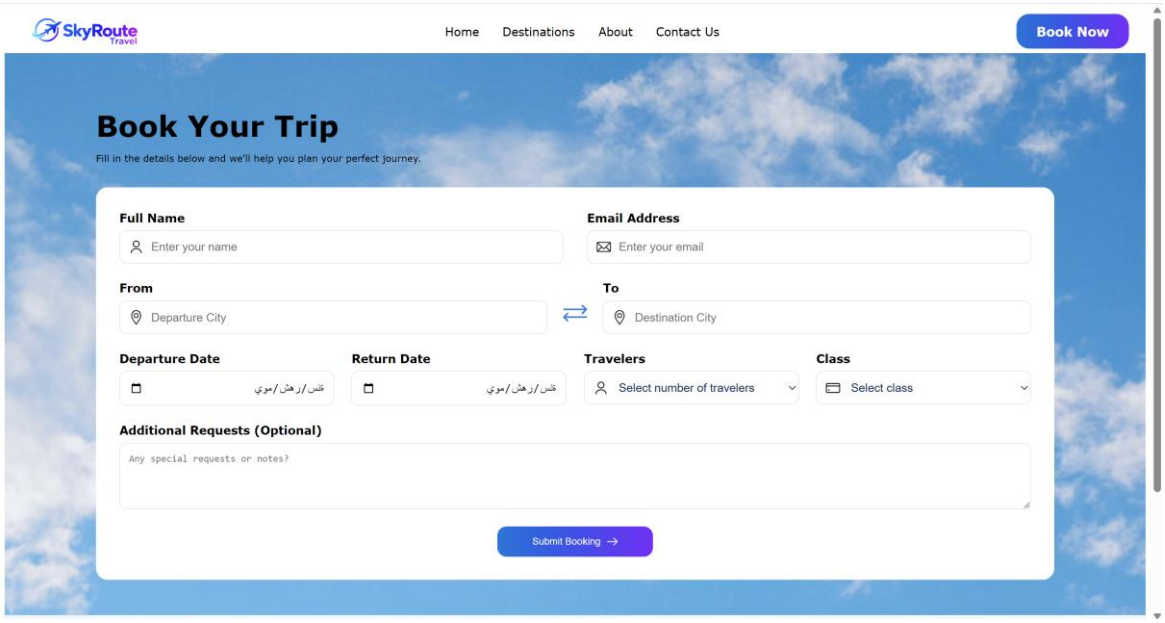

Figure 5. Booking form.

2.6 Responsive Design

Responsive behavior is implemented with media queries at a 768px breakpoint. Navigation, hero content, service cards, destination cards, the About section, contact form, and booking form change from multi-column layouts to single-column layouts on smaller screens. Relative units such as %, rem, and fr help the page scale across different devices.

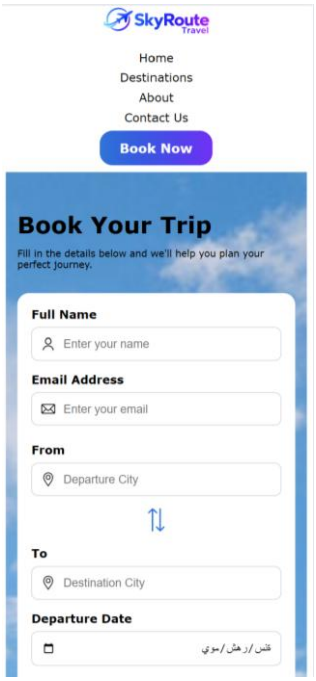

Figure 6. Mobile booking layout.

3. Code Documentation

3.1 Project Structure

The project separates HTML pages, CSS styling, and image assets into a simple folder structure. Relative paths are used so the website continues to work when the project folder is moved.

```
Project-Unit3/
├── index.html
├── book-now.html
├── README.md
├── css/
│   └── styles.css
└── images/
    └── Website images and icons
```

Figure 7. Project folder structure.

3.2 Semantic HTML Structure

Semantic HTML elements are used to keep the page structure meaningful and organized. The project includes header, nav, main, section, article, and footer elements. Service cards use article elements because each card represents an independent piece of content.

Figure 8. Semantic HTML structure.

3.3 Flexbox and CSS Grid

Flexbox is used for navigation, hero alignment, card content, footer groups, and form controls. CSS Grid is used for services, destinations, booking fields, and the contact layout. The services grid uses auto-fit and minmax() so the cards can adapt automatically to available width.

Figure 9. Flexbox and CSS Grid implementation.

3.4 Forms

The project contains a contact form and a booking form. Form controls include labels, name attributes, required fields, action and method attributes, select elements, date inputs, a textarea, and a required privacy checkbox. These elements are styled consistently with the rest of the website.

```
<form class="contact-form" action="/contact" method="post">
    <div class="contact-row">
        <div class="booking-field">
            <label for="contact-name">Full Name</label>
            <input id="contact-name" type="text" name="contact-name" placeholder="Enter your full name" required>
        </div>
        <div class="booking-field">
            <label for="contact-email">Email Address</label>
            <input id="contact-email" type="email" name="contact-email" placeholder="Enter your email address" required>
        </div>
    </div>
    <div class="booking-field">
        <label for="contact-message">Message</label>
        <textarea id="contact-message" name="contact-message" placeholder="How can we help you?" required></textarea>
    </div>
    <div class="contact-bottom">
        <label>
            <input type="checkbox" name="privacy-policy" required>I agree to the Privacy Policy
        </label>
        <button id="contact-button" type="submit">Send Message</button>
    </div>
</form>
```

Figure 10. Contact form HTML structure.

```
<section class="booking-section">
  <form class="booking-form" action="/book" method="post">
    <fieldset class="booking-row-two">...
    </fieldset>
    <fieldset>...
    </fieldset>
    <div class="booking-field">
        <label for="additional-req">Additional Requests (Optional)</label>
        <textarea id="additional-req" name="additional-req" placeholder="Any special requests or notes?"></textarea>
    </div>
    <button id="submit-button" type="submit">Submit Booking<img id="submit-arrow" src="images/right-arrow-white.png" alt="White Arrow"></button>
  </form>
</section>
```

Figure 11. Booking details form structure.

3.5 Responsive Design and Media Queries

The media query changes multi-column layouts to single-column layouts for screens up to 768px. This keeps navigation, sections, and forms readable without horizontal overflow.

```
@media (min-width: 769px) and (max-width: 1100px) {
    #about-section {...
    #about-main-img {...
    .about-details {...
    .about-details > p {...
    #about-icons {...
}

@media (max-width: 768px) {
    .hero {...
    .hero-content {...
    .hero-content h1 {...
    .hero-images {...
    .first-row-header {...
    #header-nav {...
    .services-grid {...
    .destinations-grid {...
    #about-section {...
    #about-main-img {...
    .about-details {...
    .about-details > p {...
    .about-content {...
    #about-icons {...
    .section-flex {...
    .section-nav-flex {...
    .div-flex-columns {...
    .section-flex h3 {...
    footer .logo-img {...
    .first-row-header {...
    #header-nav {...
    .booking-main {...
    .booking-main > h1 {...
    .booking-section {...
    .booking-row-two {...
    .booking-route {...
    #exchange-icon {...
    .booking-route > button {...
    .booking-details-row {...
    #submit-button {...
    .contact-section {...
    .contact-content {...
    #contact-side-img {...
    .contact-form {...
    .contact-row {...
    .contact-bottom {...
    #contact-button {...
}
```

Figure 12. Responsive media-query rules.

3.6 CSS Variables and Pseudo-elements

CSS variables are defined in :root to store the main colors used across the site. This keeps the blue, purple, dark-blue, and light background colors consistent. Pseudo-elements are used to add decorative gradient lines beneath section headings without adding extra HTML elements.

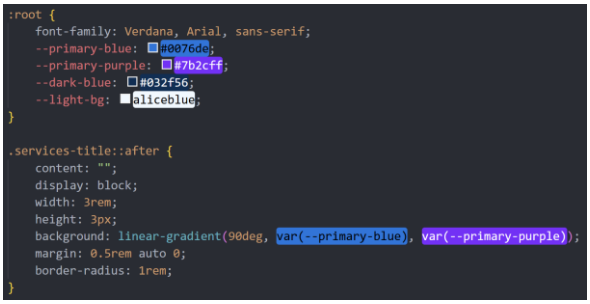

Figure 13. CSS variables and pseudo-element styling.

3.7 Transitions and Animations

The interface includes multiple CSS transitions for buttons, service cards, and destination images. Two keyframe animations are used: airplane-slide moves the airplane into the hero section, while hero-fade reveals the hero text using opacity and vertical movement. Transform and opacity are preferred to keep the motion smooth.

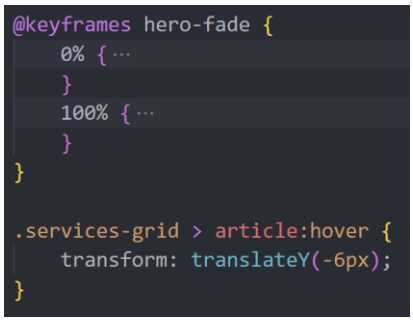

Figure 14. Keyframe animations and hover transition.

4. Conclusion

The SkyRoute Travel website demonstrates the main HTML and CSS concepts covered in Unit 3 through a complete responsive travel interface. The final project combines semantic HTML, forms, Flexbox, CSS Grid, media queries, variables, pseudo-elements, transitions, and animations in one consistent design. The website adapts to different screen sizes and provides a clear structure that can be extended with additional pages or backend functionality in the future.
